Attention Residential Roofers!

We have a couple of changes we would like to bring to your attention:

- We now require an “In Progress” Inspection on residential reroofs.
- We will be requiring a separate miscellaneous type of permit for PV removal and replacement.
- We will require strapping of the “B” vents and other types of gas appliance vents.

Inspections:

Coordination of inspections is a critical element in the success of any project. Building Inspection recognizes this and will work with the industry in adjusting inspections provided clear communication is maintained. When scheduling an In-Progress inspection you can give us a 2 hour window and we will do our best to accommodate it. If an inspection window is needed on other types of inspections, please contact your area inspector by 8:00am, the morning of the inspection.

2 inspections are required: an “In-progress” and a final. The “in progress inspection” shall have 50% of the roof completed. If the contractor exceeds the 50% completion point and does not call for the “in progress inspection”, he/she may be required to remove new material to verify that all specifications have been met to the satisfaction of the building inspector.

* Overlays (all except steel roofs) will require a final only. Only 2 layers of roofing are allowed.

PV System:

A roofing contractor is not licensed to remove or install a photovoltaic system. Work is required to be done by a licensed electrical or solar contractor. A separate miscellaneous permit will be required for removing and replacing the PV system and a roof plan will be required for that submittal. If you are adding on to the existing PV system, or installing a new PV system see Document # EC-24 for PV plan submittal requirements.

Gas Appliance Vents:

“B” vents and other types of gas appliance vents will be secured in place and visible at the “In Progress” inspection. They are required to be secured by a listed bracket, or by metal straps on both/all sides of the vent and going in both directions. “B” vents require a 1” clearance from combustibles. Single wall vents require 6” clearance from combustibles.

Scheduling the Inspection:

Inspections can be scheduled online using our IVR system or by calling (916) 875-5296

The required inspection codes are:

128 Roof - in Progress

199 Final Structural
